

## Installing Norton AntiVirus for Mac OS X

All computer users at NCI-Frederick are required to run antivirus software on their computers. If your computer runs a Macintosh operating system (including OS X), it is recommended that you install Norton AntiVirus 8.0. This is NCI-Frederick Communications' officially supported antivirus software for the Mac OS X platform.

Download the install file from NIH and decompress the packaged file.

Double click the icon "**Norton AntiVirus CD.**"

If you are installing on Mac OS X, open the folder "**Install for OS X.**" If you are installing on a previous Mac OS, open the folder "**Install for Os 8.1 – 9.x.**"

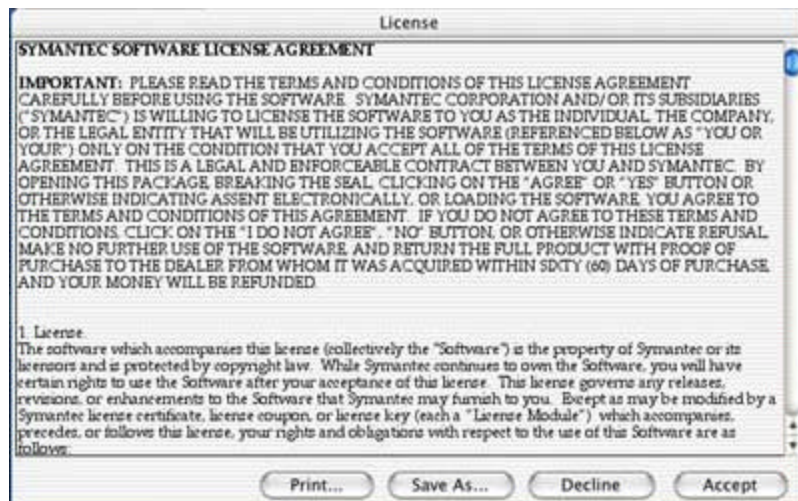

This tutorial assumes you are using OS X. If this is not correct, your screenshots will vary, but the steps will be similar.

In the Install folder, double click **‘Install Norton AntiVirus.’**

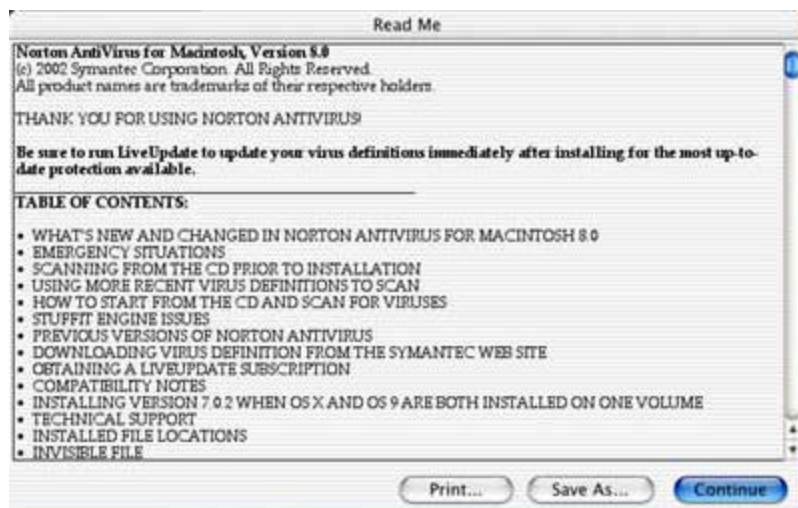

Click **Continue...** at the Norton slash screen.

To install the software, you must accept the Software License Agreement. Click **Accept** to continue with the installation.

If you do not accept, click **Decline** and the installation will exit. The software will not be installed.

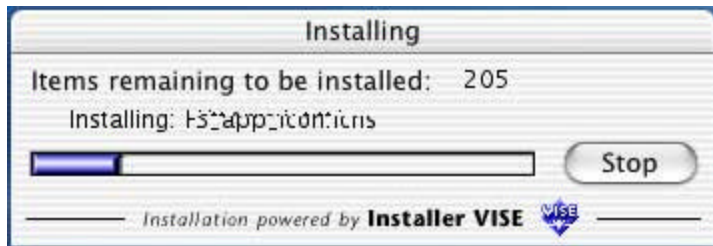

The install presents the Read Me file containing new information about the software.

Click **Continue** when ready to proceed with the installation.

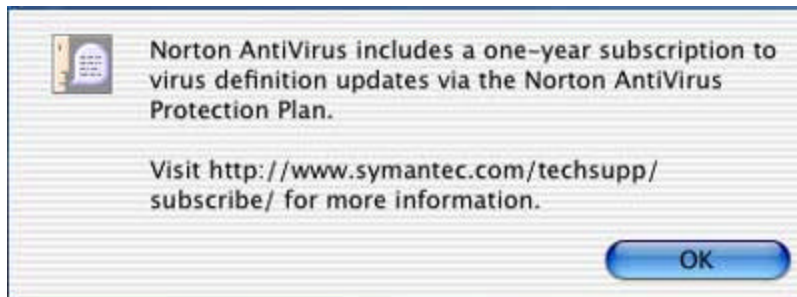

At this screen, make sure the install type is listed as "**Easy Install**."

Click **Install**.

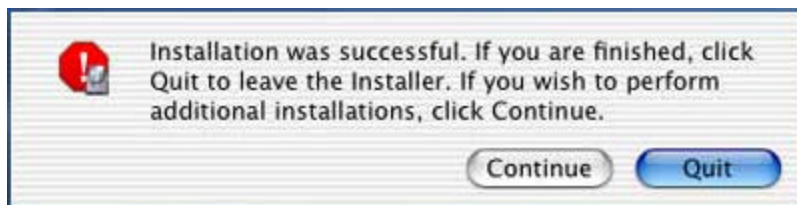

At this point, the installer will copy files to your computer.

Please wait until the install is completed.

Norton includes one year of free updates. Please click **OK** to continue.

After installation is complete, click **Quit** to finish.

After install has completed, it is recommended that you update and configure the Norton AntiVirus software. More information is available at <http://comm.ncifcrf.gov>.
